

# **Interview Case Studies**

## INSTRUCTIONS

- We ask to complete case 1 and 2, noting that case 2 requires only one of the alternatives
- Choose a programming language or tool that you are most comfortable with. R would be preferable; python works as well.
- Feel free to make assumptions about missing information and data. Comments can be kept sparse
- Submit the code along with the results.

## EVALUATION CRITERIA

- Robustness, elegance and efficiency of the code
- Good use of available options in visualisation (use of ggplot2 in R)

# Case 1 – Yield Curve analysis

## Information:

- a. Download all the zip files (*“Monthly Technical Information”*) since December 2022 from [Risk-free interest rate term structures - European Union \(europa.eu\)](https://europa.eu/economy_finance/technical_information)

## Questions:

- a. Programmatically unzip and extract country and tenor wise interest rates from the **excel** (*“EIOPA\_RFR\_YYYYMMDD\_Term\_Structures”*) and **sheet** (*“RFR\_spot\_no\_VA”*)
- b. Visualise the changes in US and Euro yield curve across tenors since 2022
- c. Compute and visualise the correlation between US/Euro/UK/China rates focusing only on 2/5/10/20/30y tenor points
- d. Compute and visualise 2 year – 10 year and 2 year – 30 year slope for US and Euro rates

o 4	-0.405%	-0.405%	-0.405%	-0.535%
r 5	-0.375%	-0.375%	-0.375%	-0.505%

# Case 2 – Value-at-Risk **or** Regression

## Information:

- a. USD 500k of equity portfolio split between Google (45%), Facebook(32%), Nvidia (10%) and Equinix Inc (13%)
- b. Use stock/index prices from yahoo (can even read the data using api)

## Questions:

- a. Compute historical simulation VaR and ES (qtl:99%, holding: 1 month, lookback: 10y). Need to address insufficient stock return of Equinix. Also, compute the contribution to total VaR of each stock
- b. Implement a simulated version of Monte-Carlo VaR for the whole portfolio (qtl: 99%, holding: 1 m)

**OR**

## Information:

- a. Download US 10-year break-even inflation rate (ticker:*T10YIE*), US 10-year and 5-year Treasury yield (*DGS10/DGS5*) from FRED (<https://fred.stlouisfed.org/> ) since 2008

## Questions:

- a. Process data to handle missing values (e.g. average, carry forward last observation) and explore the statistical properties
- b. Regress US 10y against the US Break-even. 1. Evaluate assumptions of Linear Regression 2. Perform Regression 3. Run diagnostics on model residuals to identify potential issues
- c. Compute historical simulation VaR (qtl:99%, holding: 1 month, lookback: 10y) for a portfolio with 10y Zero-Coupon (ZC) bond and 5y ZC bond (each with a face: USD 1 m). Also, compute the contribution to total VaR of each bond

**THANK  
YOU**
